TITLE: Use of liposomes as carriers for metalloporphyrins

BSPR:

Attempts have been made to target the porphyrin compounds to different sites or organs in mammals. For example, G. Jori et al in their article on "Controlled Targeting of Different Subcellar Sites by Porphyrins in Tumor-bearing Mice," Brit. J. Cancer, Vol. 53, pp. 615-621 (1986), disclose that intraperitoneal injection of liposome-bound porphyrins to mice results in more efficient tumor targeting than that obtained by administration of the same porphyrins dissolved in homogeneous aqueous solutions. These investigators were not concerned with selective targeting of normal body organs or tissue enzymes. Indeed, in a later article on "Utilization of Liposomes and Low Density Lipoproteins and Porphyrin Carriers in Experimental Photodynamic Therapy," First International Conference on the Clinical Applications of Photosensitization for Diagnosis and Treatment, Tokyo, Japan (1986), Jori discloses that the administration of liposome-vehiculated hematoporphyrin (Hp) to the tumor tissue and to the organs of the reticuloendothelial system of mice did not result in any specificity of Hp localization although it did result in larger accumulation of Hp in the tumor.

TITLE: Benzoporphyrin derivatives for photodynamic therapy

BSPR:

This invention relates generally to the treatment of tumors using the process of photodynamic therapy (PDT). In particular, the invention relates to methods of administering green porphyrins (Gp) in combination with plasma lipoproteins or liposomes ("lipocomplexes") so as to improve transport and delivery to tumors with enhanced cytotoxicity. The invention further relates to Gp-lipocomplex compositions for use in the aforementioned methods.

TITLE: In situ photodynamic therapy

ABPU:

1) separately encapsulating at least one activation component for said photodynamic therapy process in a liposome;

BSPR:

1) separately encapsulating the separate components of an activation system for photodynamic therapy in heat-sensitive liposomes;

DEPR:

It is the process of this invention, to 1) encapsulate the components of the activating systems for photodynamic therapy separately in heat-sensitive liposomes (see e.g., Radiation Research 122: 161, 1990); 2) inject the liposome encapsulated materials systemically, and 3) `melt` the liposomes (41.degree.-45.degree. C.) selectively at the tumor site using direct heat-producing systems. When the liposomes are co-melted at the tumor site, mixing of the `activator system` (generally two or three or more component systems) occurs causing a) light emission and absorption by the previously injected photosensitizer; b) energy transfer to the previously injected photosensitizer; or c) direct formation of a cytotoxic species.

CLPV:

1) separately encapsulating at least two activation components for said photodynamic therapy process in a liposome;

CLPV:

1) separately encapsulating at least two activation components for said photodynamic therapy process in a liposome;

TITLE: Liposomal delivery system with photoactivatable triggered release

BSPR:

Yet another object is to provide an improved liposome suitable for use in photodynamic therapy.

DEPR:

PlasPPC/DPPC (9:1 mol/mol) vesicles for photodynamic studies were prepared by dissolving dry lipids in chloroform and removing the solvent with a stream of argon. The resultant lipid film was then dried under vacuum for 1-2 hours to remove entrapped solvent. An ethanolic stock solution of ZnPc was prepared by dilution from a 5 mM pyridine solution of the sensitizer. Then, 100-200 .mu.l of the ethanolic ZnPC was added to 2.8 ml of 20 mM Tris, pH 8, containing 165 mg of glucose (.about.0.3 M). The suspension was warmed to 45.degree. C., vortexed, and put through five freeze-thaw cycles with the liposomes. Finally, the suspension was extruded ten times through stacked 0.08-micron Nucleopore filters using a Lipex Biomembranes Extruder thermostated at 47.degree. C. Unentrapped sensitizer and glucose were removed by passage down a small buffer-equilibrated Sephadex G-25 column. UV-vis analysis (after solubilization with 10% Triton X-100) and phosphorus assay as described by Petitou, Anal. Biochem. 91:350-53 (1978) indicated that the concentration of ZnPc and lipid in these vesicles was 0.05-0.1 .mu.M and 4.8 mM, respectively.

DEPR:

While the type II production of singlet O.sub.2 is thought to be the predominant mechanism in many photodynamic sensitizations, the type I free radical pathway can become important under certain conditions. These include membrane binding of the sensitizer, high lipid/oxygen ratios in the immediate environment of the sensitizer, and high light intensity. When added to PC liposomes, ZnPc is thought to be localized in the hydrophobic bilayer interior. The inventors also believe that the ZnPc dye is similarly incorporated into the bilayer of plasmalogen liposomes such that the local concentration of lipid is high. Hence, the type I pathway may play an important role in ZnPc sensitization of the liposomes of the present invention.

DEPR:

This Example describes the use of AlClPcS sensitizer, a water-soluble phthalocyanine localizing in the aqueous core of the vesicle, to produce photomodifications of plasmalogen liposomes via photodynamic mechanisms. The structural formula of the photosensitizer AlClPcS used in this study is shown below. ##STR8##

DOCUMENT-IDENTIFIER: US 5389378 A

TITLE: Benzoporphyrin vesicles and their use in photodynamic therapy

BSPR:

The present invention relates to the discovery that benzoporphyrin derivatives (BPD), for example, diacids and monoacids and in particular, Monoacid A, which are otherwise insoluble in aqueous systems, may be incorporated into liposomes at high drug to lipid ratios. These pharmaceutical compositions of the present invention are especially useful for treating cancerous tissue by the therapeutic technique known as photodynamic therapy. These compositions are also useful as anti-viral agents.

CLPR:

1. A composition for treating cancerous tissue with photodynamic therapy consisting of a photosensitizing effective mount of a benzoporphyrin, which is not complexed to a metal, in liposomes, and a pharmaceutical carrier, wherein said benzoporphyrin is selected from the group consisting of benzoporphyrin monoacid A, monoacid B, diacid A, diacid B and mixtures thereof, and wherein said composition has a benzoporphyrin to lipid ratio greater than 100 .mu.g benzoporphyrin per mole lipid.

CLPR:

14. A method for treating cancerous tissue using photodynamic therapy in a patient comprising administering to said patient a composition consisting of a photosensitizing effective amount of a benzoporphyrin, which is not complexed to a metal, in liposomes, and a pharmaceutical carrier, wherein said benzoporphyrin is selected from the group consisting of benzoporphyrin monoacid A, monoacid B, diacid A, diacid B and mixtures thereof, and wherein said composition has a benzoporphyrin to lipid ratio greater than 100 .mu.g benzoporphyrin per mole lipid.
